

# xtpxlib/xdocbook module - Docbook 5 dialect description

Erik Siegel - Xatapult - March 2018

## 1 Introduction

The xtpxlib/xdocbook module uses DocBook 5 as its target vocabulary. However, it does not implement the full standard (which is huge!) but only those elements/attributes that were deemed necessary. This document will explain what is in and what's not.

## 2 The xtpxlib Docbook 5 dialect

### 2.1 Document information

**Document information:** The only document information elements recognized are (any others are ignored):

```
<info>

  <title> ... main title ... </title>
  <subtitle> ... subtitle ...</subtitle>
  <pubdate> ... publication date ... </pubdate>
  <author>
    <personname> ... author name ...</personname>
  </author>

  <orgname> ... organization ... </orgname>

  <mediaobject role="top-logo">
    <!-- Use either role="top-logo" or no role attribute. -->
    <imageobject>
      <imagedata fileref="..." width="...(opt)" height="...(opt)"/>
    </imageobject>
  </mediaobject>

  <mediaobject role="center-page">
    <imageobject>
      <imagedata fileref="..." width="...(opt)" height="...(opt)"/>
    </imageobject>
  </mediaobject>

</info>
```

All elements are optional.

### 2.2 Chapter/Section structure

<preface>, <chapter> and <sect1> to <sect3> are recognized and handled.

### 2.3 Block constructions

the following block constructions are recognized and handled:

- **Paragraphs:** Normal <para> elements recognize the following role attribute values (multiple values allowed):

@role value	Description
break, smallbreak	Inserts an empty line, either full or small height. The contents of the <para> element is ignored.
break-before break-after	Adds extra whitespace before or after the paragraph
header keep-with-next	Keeps this paragraph with the next one together on a page.

@role value	Description
keep-with-previous	Keeps this paragraph with the previous one together on a page.

Table 2-1

- **Lists:** Both `<itemizedlist>` and `<orderedlist>` are allowed.
- **Tables:** Both `<table>` and `<informaltable>` are allowed. An example of a formal table above. An informal table below.

Example of an informal table

Add `role="nonnumber"` to a table to stop it from getting a number:

Blurb	Blorb
Example	of
an	unnumbered table

Unnumbered table

Tables are notoriously difficult in that FOP cannot compute column widths automatically. To amend this (a little bit) add `colspec/@colwidth` information.

- **Program listings:** For program listings use the `<programlisting>` element  
The easiest way to handle this turned out to put longer program listings in external files and use an `<xi:include parse="text">` construction:  

```
<programlisting><xi:include href="ref" parse="text"/></programlisting>
```

Otherwise you have to use a `<![CDATA[` construction around the piece of code.
- **Figures:** Both `<figure>` and `<informalfigure>` are allowed. Width and height can be set on the image data.

Figure 2-1 - An example of a figure... (this in fixed width)

Add `role="nonnumber"` to a figure to stop it from getting a number.

- **Bridgeheads:** The `<bridgehead>` element inserts a bridgehead paragraph (bold, underlined and with an empty line before):

**This is a bridgehead...**

- **Simple lists:** The `<simplelist>` element inserts a simple list:

An entry  
Another entry...

- **Variable lists:** The `<variablelist>` element inserts a variable list list (also very useful for explaining terms, definitions, etc.):

**The first entry**

The explanation of the first entry!

**The second entry**

The explanation of the second entry!

- **Notes and warnings:** The `<note>` element inserts a note and `<warning>` a warning:

**NOTE:**

This is a note! Nulla ac ex urna. Ut auctor odio quis nulla porta bibendum. Proin hendrerit molestie velit sit amet tristique. Vivamus laoreet ligula leo, vitae placerat ipsum porta sed. Morbi blandit ex mauris, eu volutpat tortor mattis eu. Nam et molestie mi. Aliquam erat volutpat. Aenean a imperdiet lectus. Phasellus condimentum dignissim laoreet.

**WARNING:**

This is a warning! Nulla ac ex urna. Ut auctor odio quis nulla porta bibendum. Proin hendrerit molestie velit sit amet tristique. Vivamus laoreet ligula leo, vitae placerat ipsum porta sed. Morbi blandit ex mauris, eu volutpat tortor mattis eu. Nam et molestie mi. Aliquam erat volutpat. Aenean a imperdiet lectus. Phasellus condimentum dignissim laoreet.

- **Sidebar:** The `<sidebar>` element inserts sidebar section:

**Title of the sidebar**

Contents of the sidebar. Nulla ac ex urna. Ut auctor odio quis nulla porta bibendum. Proin hendrerit molestie velit sit amet tristique. Vivamus laoreet ligula leo, vitae placerat ipsum porta sed. Morbi blandit ex mauris, eu volutpat tortor mattis eu. Nam et molestie mi. Aliquam erat volutpat. Aenean a imperdiet lectus. Phasellus condimentum dignissim laoreet.

- **Examples:** The `<example>` element inserts an example:

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Vivamus elementum diam nec nunc elementum, eget dapibus dui malesuada. Aenean facilisis consequat odio, vitae euismod eros tempor nec. Vestibulum cursus tortor tortor, semper euismod sapien sagittis et.

*Example 2-1 - Example of an example*

Add `role="nonumber"` to an example to stop it from getting a number.

## 2.4 Inline elements

the following inline elements are recognized and handled:

- **`<emphasis>`:** Sets *emphasis*.  
Use `role="bold"` or `role="underline"` to set a specific type of emphasis.
- **`<literal>` or `<code>`:** Creates a piece of literal, mono-spaced text.
- **`<link>`:** Outputs some link (e.g. a web address). This is either the contents of the element or, if not available, the contents of the `xlink:href` attribute.  
Like [this](#) or like this <http://www.xatapult.nl>.
- **`<inlinemediaobject>`:** Inserts an inline image:  like this.
- **`<citation>`:** Inserts a citation between square brackets like this: [CITATION].
- **`<command>`:** Use to indicate an executable program or a user provided command, like this: `git checkout origin`
- **`<email>`:** Use to indicate an email address, like this: [info@xatapult.com](mailto:info@xatapult.com)
- **`<filename>`:** Use to indicate a filename, like this: `blabla.xml`

- **<replaceable>**: Use to indicate text to be replaced with user or context supplied values, like this: *add your own stuff here*
- **<keycap>**: Use to indicate a keyboard physical key, like this: `Return`
- **<superscript>**, **<subscript>**: For super- and subscripts, like this:  $XX^{\text{super}}YY_{\text{sub}}$
- **<userinput>**: Use to indicate data entered by the user, like this: **data entered here**
- **<tag>**: Indicates an object from the XML vocabulary. The `class` attribute signifies what:

@class value	Result example(s)
attribute	@attribute @class
attvalue	"attribute value" "some value for an attribute"
emptytag	<element/> <docbook/>
endtag	</element> </docbook>
pi	<?processing-instruction x="y"?>
comment	<!-- Some comment line... -->
Anything else defaults to element	<element> <docbook>

Table 2-3

- **<xref>**: Inserts a cross-reference to the id referenced by @linkend

Target	Result
To anything that holds an xreflabel attribute	"paragraph with xreflabel attribute" on page 1
To a chapter	"The xtpxlib Docbook 5 dialect" on page 1
To a section	"Document information" on page 1
To a table (with a number), like this one	Table 2-4
To a figure (with a number)	Figure 2-1
To an example (with a number)	Example 2-1
To anything else	First paragraph: page 1 Unnumbered table: page 2

Table 2-4

Use `xref/@role="capitalize"` to force the reference string (for chapters/pages) to start with an upper-case character (so you can be sure a sentence that starts with an `<xref>` always starts with a capital). Like this: "The xtpxlib Docbook 5 dialect" on page 1.

## 2.5 Other constructs

- **To-be-done marker**: Start a to-be-done marker with `[[TBD` and end it with `]]`: `[[TBD this needs to be done...]]`
